

Vibratory Drilling Services

MicroWells are a fast, efficient, cost-effective alternative to conventional drilling for your site investigations. You save money and time because the diameter of the well is small and the purge volume is removed rapidly and inexpensively. Installations are performed without drilling fluids and generate no soil cuttings. You benefit from immediate sampling and can choose successive depths for complete vertical profiling. You can save more by adding our mobile lab to your field investigation program for real time decision making and plume tracking.

Groundwater • Soil • Soil Gas • Sediment

- **Reliability**
- **Flexibility**
- **Savings**

Applications

- Rapid site investigation
- Vertical profiling
- Plume delineation
- Dynamic sampling programs/Triad Approach
- Remedial injection
- Permeability testing

Major Advantages

- Low impact all terrain vehicles
- No drilling fluids or soil cuttings
- Low purge volumes
- Rapid installations and immediate sampling
- Sample multiple depths from single well installation
- Custom screen lengths available (inches to tens of feet)
- More data per budget dollar

We offer flexible field investigation programs that can be tailored to your project needs.
